■ **How different control should be introduced?** The researchers also found that heavily interventionist control shapes different activity patterns, resulting with a reduction in peak, continuous movement behaviour. In contrast, less control may, potentially, encourage more varied movement patterns, thereby, for instance, leading to more sustained, continuous movement, even, rather than intermittent, the typical pattern reported in the study.

4. Results are generally interpreted to reinforce the notion of their own attachment theory (attachment anxiety and attachment avoidance), by relating their personal preferences to their personal contacts and social behavior, as opposed to studies of others' social, sharing system related behaviors consistent with attachment orientation.

• Every business needs control to deal with its differences. Relatively unexploited for a long time, control systems are becoming more important as the business environment grows more complex. There are many things to be controlled, and the control system must be able to cope with an ever-changing environment, often very different from the one that created it.

■ To ensure that business and industry have sufficient time to prepare their input, comments should be received by the Commission on or before the date indicated.

Although the fatigue tests were conducted at constant displacement (single-point) effectively this is tantamount to constant load because every reaction of the secondary beam caused displacement of the primary beam to maintain constant displacement. Hence all the fatigue tests were conducted at constant load.
